Assignment 5

Implement Gradient Descent Algorithm to find the local minima of a function.

For example, find the local minima of the function y=(x+3)² starting from the point x=2.

Step 1 : Initialize parameters

In [3]:
```
cur_x = 2 # The algorithm starts at x=3 rate
= 0.01 # Learning rate
precision = 0.000001 #This tells us when to stop the algorithm previous_step_size
= 1 #
max_iters = 10000 # maximum number of iterations

iters  =  0 #iteration  counter  df  =  lambda  x:
```

2*(x+3) *#Gradient of our function* **Step 2 : Run a**

loop to perform gradient descent :

```
In [5]: while previous_step_size > precision and iters < max_iters:
            prev_x = cur_x #Store current x value in prev_x
            cur_x = cur_x - rate * df(prev_x) #Grad descent
            previous_step_size = abs(cur_x - prev_x) #Change in x
            iters = iters+1 #iteration count
            print("Iteration",iters,"\nX value is",cur_x) #Print iterations

        print("The local minimum occurs at", cur_x)
```

```
Iteration 1
X value is 1.9
Iteration 2
X value is 1.8019999999999998
Iteration 3
X value is 1.70596
Iteration 4
X value is 1.6118408
Iteration 5
X value is 1.519603984
Iteration 6
X value is 1.42921190432
Iteration 7
X value is 1.3406276662336
Iteration 8
X value is 1.253815112908928
Iteration 9
X value is 1.1687388106507495
Iteration 10
X  l   i  1 0853640344377344
```

```
In [6]: print("The local minimum occurs at", cur_x)
```

```
The local minimum occurs at -2.999951128099859
```

```
In [ ]:
```
